

interaction at the site of action (biotic ligand) of toxicity need to be considered. Mortality occurs in aquatic organisms when the concentration of metal bound to the biotic ligand (e.g., fish gill) exceeds a certain threshold concentration. More detailed information on the biotic ligand model can be found in the document entitled, Integrated Approach to Assessing the Bioavailability and Toxicity of Metals in Surface Waters and Sediments (EPA-822-E-99-001).

To help assess the applicability of the biotic ligand model to the aquatic life criteria for these four metals, EPA is interested in receiving toxicity test data that include measurements of dissolved metal as well as: dissolved organic carbon (DOC), alkalinity or dissolved inorganic carbon (DIC), pH, calcium, magnesium, sodium, chloride, sulfate and sulfide. Additionally, studies that measure metal accumulation at the surface of the fish gill or at physiologically active receptor sites for invertebrates are particularly useful.

Where Can I Find More Information on EPA's Revised Process for Developing New or Revised Criteria?

The Agency published detailed information about its revised process for developing and revising criteria in the **Federal Register** on December 10, 1998 (63 FR 68354) and in the EPA document entitled, National Recommended Water Quality—Correction (EPA 822-Z-99-001, April 1999). The purpose of the revised process is to provide expanded opportunities for public input, and to make the criteria development process more efficient.
